Continued Repression

The last three months have validated the macro perspective we laid out in our Q3 Outlook, “The Volcker Playbook.” Inflation has proven stickier than many market participants expected, Fed Chair Jerome Powell has maintained hawkish rhetoric, and we continue to believe it remains more likely than not that this cycle will ultimately result in a recession.

Market participants perpetually underestimated the Fed’s willingness to remain accommodative following the financial crisis of 2008. We assess that they are making the opposite error this cycle by consistently underestimating the resolve of the Fed to fight inflation. Our focus in this quarterly is examining those market expectations and whether they are yet creating risks worth taking in capital markets.

Inflation and Federal Reserve Policy

The Fed remains in full-hawk mode, but markets have slowly caught up. A third 75bps hike in September put the Fed Funds target at 3–3.25%. Market participants now expect another 75bps hike in November, 50bps in December, and one or two 25bps hikes early in 2023. This path would put us at a terminal Fed Funds rate of 4.25–4.5% (Fig. 1).

Will it be enough? Aggregate nominal income growth remains a key leading indicator — inflation will remain elevated as long as aggregate incomes continue to grow at nearly 10% (Fig. 2). Income growth must dissipate for inflation to decline, and the Fed will want to see consistently lower inflation numbers before pausing. We’re a long way from that eventuality, leading us to believe the risk of a tightening cycle that lasts well into next year is currently underappreciated by market participants.

Interest Rates

We’ve communicated 3.5% as a reasonable target for the 10-year Treasury note based on the simple observation that the 10-year Treasury rarely trades above the Federal Open Market Committee ([FOMC](#)) [median long-term projection for the Fed Funds rate](#) (Fig. 3).

Market participants, as measured by the Treasury Forward Curve, now expect the 10-year Treasury to average 3.5% for the foreseeable future. Our updated assessment is that the 10-year could trade up to 4.5% over the next six months, particularly if aggregate income growth doesn’t subside by the end of 2022.

Credit

Credit spreads, a measure of the compensation received for accepting company-specific credit risk when purchasing a bond, remain near their long-term averages. The credit spreads for the Bloomberg US Corporate Index and the US Corporate High Yield Index is 1.55% and 5.26%, respectively (Fig. 4). While spreads are higher than they were this time last year, they remain below the levels we typically see during recessions. Investment grade and high yield corporate spreads frequently exceed 3% and 8%, respectively, during recessions.

Relative complacency in credit markets can be interpreted as a positive indication that market participants believe corporate balance sheets are sufficiently strong to withstand an economic downturn, but the risks to that perspective are skewed to the downside. We're comfortable maintaining near-benchmark investment grade corporate bond exposure in our taxable fixed income portfolios but have yet to add a tactical high yield position.

Equities

We assess that interest rates have been the main driver of equity market declines this year. Longer-duration equities (e.g., growth stocks) have underperformed shorter-duration equities (e.g., value stocks), and valuations in equity markets also compressed as interest rates rose. US equities currently trade at 17x forward earnings — a valuation that aligns with the longer-term corridor of fair value (Fig. 5).

We do not believe meaningful reductions in corporate earnings have been priced into US equities. In the short term, our analysis indicates a soft-landing scenario that cuts S&P 500 earnings by 10% would lower the fair value of the S&P 500 by approximately 5%. A hard-landing 20% decline in earnings implies a more meaningful fair-value reduction of 7–10%.

On the other hand, higher interest rates and lower equity valuations imply higher forward-looking equity returns over the next 7–10 years. Our current capital market assumption for US equities stands at 9.2%, a significant revision upward from the beginning of the year and a number that should be quite attractive to most equity investors. We sometimes joke that it's a bad sign to enter a "Warren Buffett quote" market environment, but his adage "the stock market is a device to transfer money from the impatient to the patient" certainly seems worth considering.

Our Positioning

While we take tactical positions in portfolios, we eschew market timing and forecasting. Our process starts by reading the expectations implied in market valuations and then considering potential revisions to those expectations and

assessing the risk-adjusted return prospects for various markets.

Within equities, we maintain a preference for the US versus international markets. This position has worked well since its inception in March 2020, but dollar strength (Fig. 6) and low relative valuations for international equities now put continued outperformance at risk. Our intention, at this point, is to maintain a US overweight until we see catalysts that could unlock valuation and currency tailwinds for international equities.

We're also overweight value versus growth within large-cap US equities. As discussed earlier, rising interest rates tend to punish growth equities more than value equities and, despite underperformance over the last two years, growth-oriented equities continue to trade at an unusually high premium to value equities (Fig. 7).

Several clients have pointed out that the 8.5% yield-to-worst for the US high yield index appears compelling from a total yield perspective, but it is important to note that much of that yield is generally driven by higher US Treasury rates. As discussed earlier, the Bloomberg US Corporate High Yield credit spread is at about 4.7%, far below the 8% or high spreads commensurate with historical recessions. We continue to monitor credit markets and watch for attractive tactical entry points.

Our perspective on a broader range of markets, along with links to relevant publications, can be found in our House View summary on page 4.

Buy the Dip?

Financial markets have a way of bringing out the worst reactions in all of us. Investors intellectually understand that seeking day-to-day certainty comes at a large long-term opportunity cost, but time horizons ebb and flow with the ups and downs of the market. Furthermore, naively "buying the dip" is little more than market timing.

We want to be prudent and proactive during times of volatility by combining an intrinsic value framework with appropriate time horizons. US equities currently provide a good example of how this process can work. Over a one-month period, the odds of a positive return in equities are only a bit better than a coin toss (Fig. 8), and substantial losses of -10 or -20% loom large. Investors that need month-to-month price stability should stick with cash. On the other hand, global equities have produced positive returns 99% of the time over 10-year horizons. That high probability of a positive return, coupled with a multi-year high forward-looking estimate return on US equities, makes this a prudent entry point for investors looking to put cash to work in the equity market.

House View Summary

Global economy

- While most global central banks are hiking rates in unison, economic conditions are far from similar.
- US growth continues to moderate but remains at or above the long-term trend. As a result, nominal aggregate income growth needs to decline by nearly half — to about 5% — for the Fed to reach their inflation target.
- We believe Powell is [following the 1979–1982 Volcker playbook](#). The Fed won't ease, regardless of economic growth concerns, until inflation has suitably declined over a sustained period.
- [Europe appears headed for stagflation](#) (elevated inflation and recession) and energy supply remains a significant risk through the winter.
- Some pundits have suggested China will loosen their zero-COVID policy after the party congress in October, but China's [commitment to a zero-COVID policy appears strong](#). China continues to support economic stability through targeted fiscal stimulus while also supporting the Yuan against a strong dollar.

Market perspective

- The Fed will likely hike until [short-term interest rates are at or near 4.5%](#). Further hikes will be data dependent.
- We believe 4–4.5% represents a reasonable cap on the 10-Year Treasury yield for 2022.
- We [continue to watch for a tactical entry point](#) for high yield corporate bonds, but credit spreads would need to increase by another 200bps to justify the potential risk.
- Rising interest rates have been the main catalyst for US equity losses this year. Equity markets have not priced negative [earnings revisions](#) into the market, and further near-term downside remains possible if earnings are revised down significantly.

Despite (or because of) near-term uncertainty, [forward-looking equity returns](#) have risen to multiyear highs.

- European equities [currently trade at a historically large discount](#) to US equities, but the overhang of geopolitical risk prevents us from tactically overweighting European equities at the current time.
- We expect broad commodity prices to continue declining as global economic growth slows.
- The housing market, an important leading indicator for the US economy, [has slowed considerably](#). Overall inventory remains historically low, but a record 7.3 months of new homes under construction will put pressure on prices through the remainder of 2022.

Portfolio positioning

- We are neutral duration in our taxable and tax-exempt fixed income portfolios.
- We are overweight high yield municipal bonds in our tax-exempt FI portfolios.
- Within equities, we are overweight US versus international, large-cap value versus growth, and global small-cap equities.
- We are overweight private debt and absolute return hedge funds versus fixed income.
- We recommend allocating a portion of equity exposure to [private equity](#).

Risks we're watching

- Sustained oil prices above \$150 per barrel
- US inflation that remains persistent and unresponsive to Fed action
- Exacerbated geopolitical tensions spilling out of the Russia-Ukraine war or China

Third Quarter 2022: Market Review

Fixed Income

- Sovereign bond yields increased by 1-3% across most developed countries.
- The Bloomberg US Aggregate Bond Index declined by over 5%. The Bloomberg Global Aggregate ex-USD Bond Index fared even worse, declining by over 14%.
- Credit spreads increased over the quarter and US corporate high yield bonds declined nearly 2% on a total return basis.

Equities

- Global equities continued to decline. US equities significantly outperformed international and emerging market equities.
- US growth outperformed US value.
- Small cap slightly outperformed mid and large cap equities.

Will near-term pain create better long-term opportunity for equity investors?

Interest Rates and Inflation

The Fed's resolve to rein in inflation via multiple interest rate hikes has driven sustained price volatility in 2022. Moreover, higher rates have led to a significant rerating of longer-duration growth equities while providing a meaningful boost to the US dollar. This has negatively impacted international equities for dollar-based investors. In the short run, additional rate hikes may impact consumer demand and corporate profits. Still, higher rates and lower valuations should signal higher future expected returns for longer-term investors.

Corporate Earnings

Management teams and analysts are concerned about a potential recession reflected in lower guidance and significant downward earnings revisions from the end of the second quarter. As a result, third-quarter estimates have been revised down by over 6% so far, but full-year earnings growth is expected to be in the mid-to-high single digits (Fig. 1).

The consensus outlook for earnings in 2023 appears optimistic given the current trend of downward revisions, which have yet to be priced in. Analysts expect around 7% growth in 2023 to around \$240. A soft-landing scenario could see earnings decline about 10% to \$200, while a hard-landing scenario could see earnings decline by 20% to around \$180. We believe the potential for further downward revisions remains as Powell stays hyper-focused on inflation even if it brings "some pain."

Valuations

Based on consensus estimates from Bloomberg, the S&P 500 trades at 17x forward earnings as prices have fallen significantly. In contrast, earnings growth has been resilient, leading to a 25% reduction in the forward multiple. Historically, the market is neither cheap nor expensive. Our position is that the market trades around fair value. In an absolute sense, the market still looks expensive, but on a relative basis, the yield gap vs. the real 10-year US Treasury remains over 5%, which is in line with long-term averages.

Overseas, the macroeconomic outlook appears weak, reflected in market valuations that have also rerated lower this year (Fig. 2). The MSCI EAFE index trades at 12x forward earnings and yields 3.5%, while the MSCI Emerging Markets index trades at 11x forward earnings and yields 3.0%. The US market has traded at a premium to the non-US market for years, but at some point, these valuations may become too attractive to ignore, especially if we begin to see a reversal in the strength of the US dollar.

Outlook and Positioning

In the short run, we remain cautious on equities, particularly growth equities, which have borne the brunt of the Fed's tighter monetary policy. Our portfolios have meaningful exposure to value stocks, which should do well as rates rise. We maintain an allocation to high-quality growth stocks through active managers who have shown an ability to grow revenues and add market share. We remain underweight in international equities including emerging markets. Our forward-looking capital market assumptions have equities earning high-single-digit returns now. As valuations have come down, global equities remain relatively attractive versus bonds for patient investors.

Investment strategy for foundations

Key message

Foundation and endowment portfolio managers face a difficult environment due to low interest rates and high inflation. A forward-looking return hurdle based on market-derived expectations for inflation and interest rates indicates that the total return necessary to meet typical foundation portfolio objectives are near all-time highs (Fig. 1). While some investment committees and portfolio managers will be compelled to “risk up” to try to meet their return and distribution objectives, doing so creates a nuanced set of trade-offs that impact the broader objectives that most foundations consider when determining success or failure.

Our view

1. Foundations face a challenging environment

- Periods of high interest rates and low inflation are Goldilocks for foundations. We are unfortunately not in such an environment.
- In order to maintain the inflation-adjusted value of its corpus, a foundation has to produce returns equal to or exceeding its distribution rate plus inflation.
- Market participants currently expect inflation to average 2.5–3% over the next five years.
- This means a foundation spending 5% annually would need to average returns of 7.5–8% to maintain the inflation-adjusted value of its corpus.
- A 60/40 equity/bond portfolio has produced annualized returns of about 6% over the last two decades.

2. Return objectives should be balanced with spending policy

- Inflation-adjusted interest rates remain below 1%, forcing foundations that want to distribute 4–5% into holding and navigating risk assets.
- Prospective returns for balanced portfolios have improved significantly in 2022 (Fig. 2), but portfolio volatility creates path dependency and meaningful drawdowns over periods as short as five years.
- We believe some exposure to private assets can help provide diversification, bolster returns, and dampen realized volatility.
- We also believe it is important to hold at least three years of targeted spending in liquid assets like high-quality fixed income. These assets can be spent during downturns instead of “dollar cost ravaging” out of equities.

Chief Investment Officer Michael Crook provides investment update

On September 22, we hosted an Investment Update Livestream where we were joined by CIO Michael Crook and guest speaker Jason Diefenthaler, Head of Municipal Bond Strategies at Wasmer Schroeder. First, Michael provided our outlook on the financial markets, including historical context, a comparison to the Volcker period, and insight on the path ahead for markets as the Fed attempts to bring inflation under control. Then, Jason gave insight into the municipal bond market.
